NARRAGANSETT BAY
ESTUARY PROGRAM

NEIWPCC

New England Interstate Water
Pollution Control Commission

A coastal scene with waves crashing against a rocky shore under a hazy sky. The foreground is filled with large, smooth, light-colored rocks. The ocean is turbulent, with white foam from the waves crashing against the rocks. The sky is a pale, overcast grey, suggesting a misty or foggy day. The overall tone is muted and atmospheric.

Although the information in this presentation has been funded wholly or in part by the United States Environmental Protection Agency under agreement CE96184201 to NEIWPC, it has not undergone the Agency's publications review process and therefore, may not necessarily reflect the views of the Agency and no official endorsement should be inferred. The viewpoints expressed here do not necessarily represent those of the Narragansett Bay Estuary Program, NEIWPC, or EPA, nor does mention of trade names, commercial products, or causes constitute endorsement or recommendation for use. Results discussed in this document are preliminary and have not been reviewed by NEIWPC or NBEP.

Overview

1. Project description
2. Evaluation of rapid field tests
3. Evaluation of Performance of Advanced N removal OWTS in the Narragansett Bay Watershed
4. Predictors of effluent total nitrogen
5. Conclusions

Nitrogen Loading and Coastal Ecosystems: Rhode Island

Algal Bloom-
Narragansett Bay

Fish Kill-
Greenwich Bay

Addressing Eutrophication

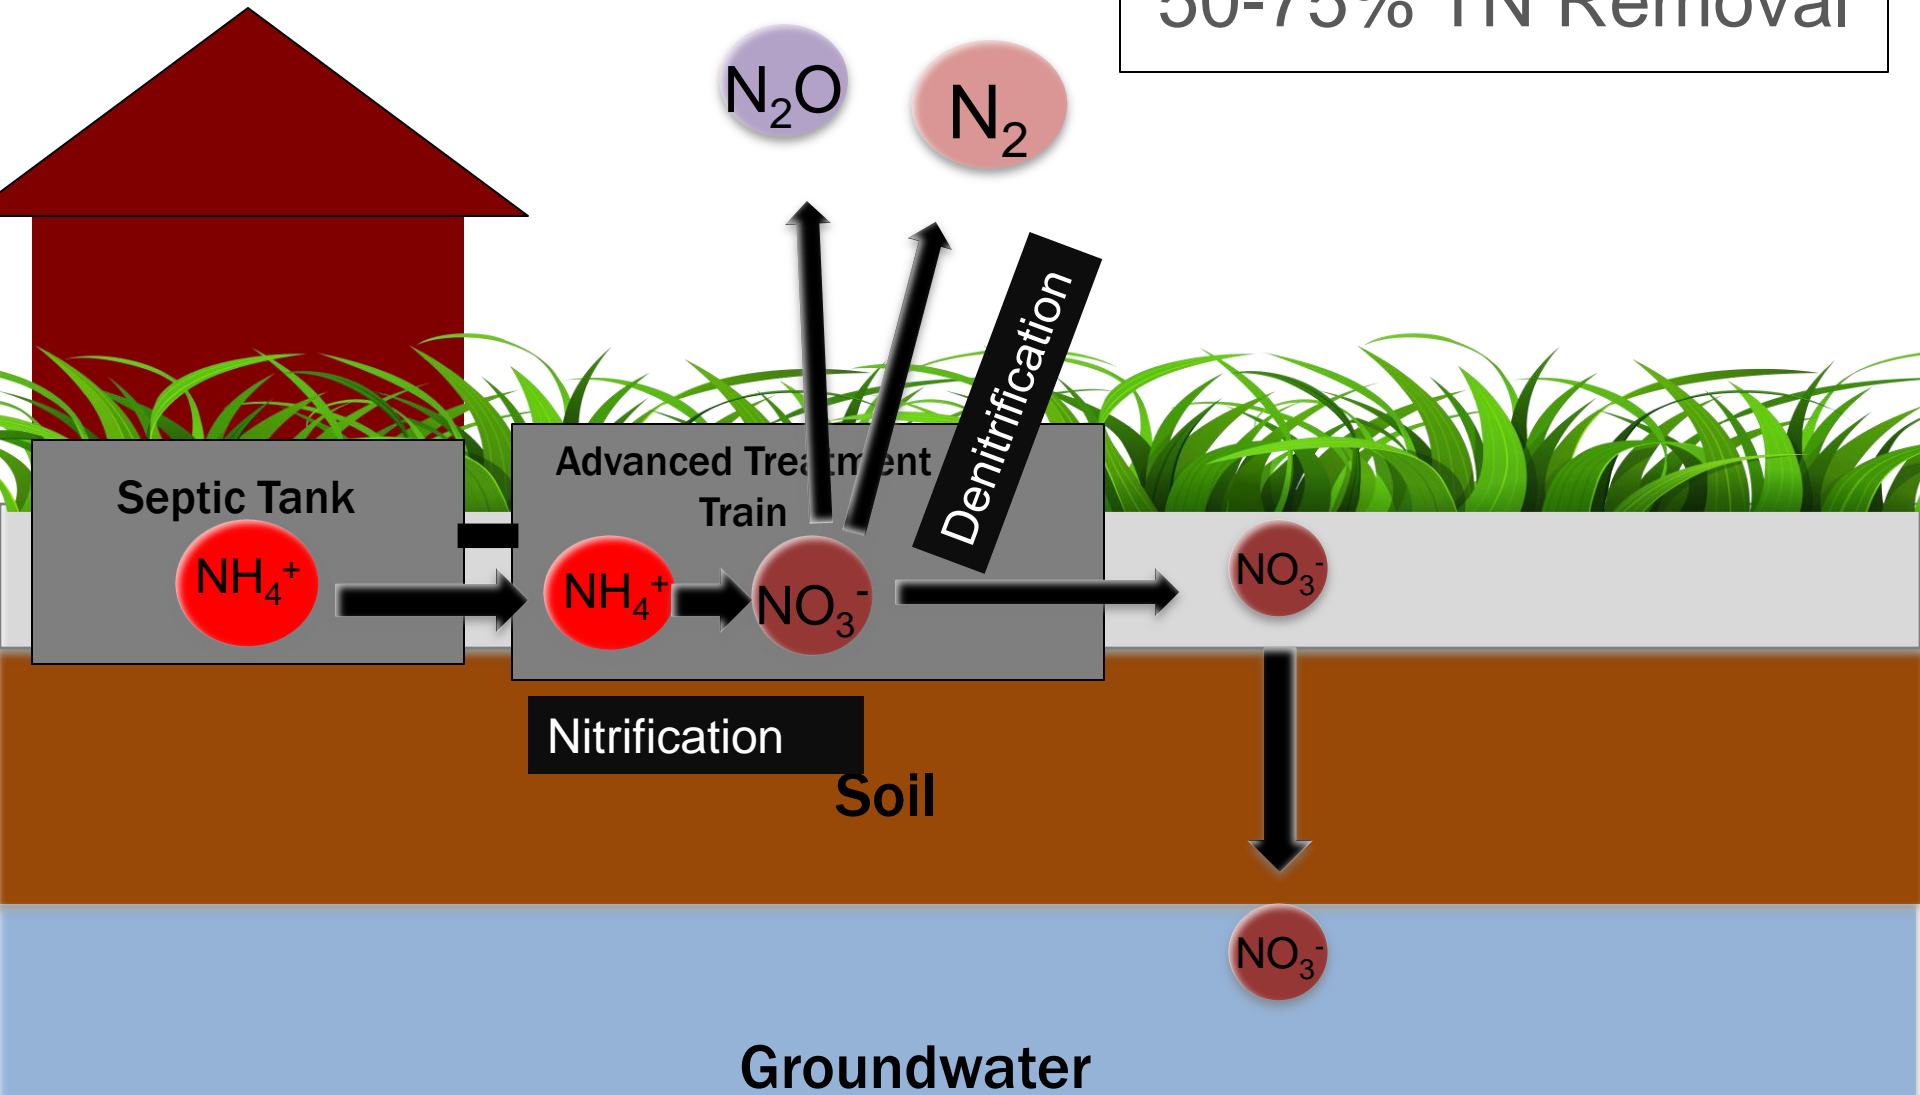

Advanced Nitrogen Removal OWTS

19 mg N/L Total Nitrogen Final Effluent Standard

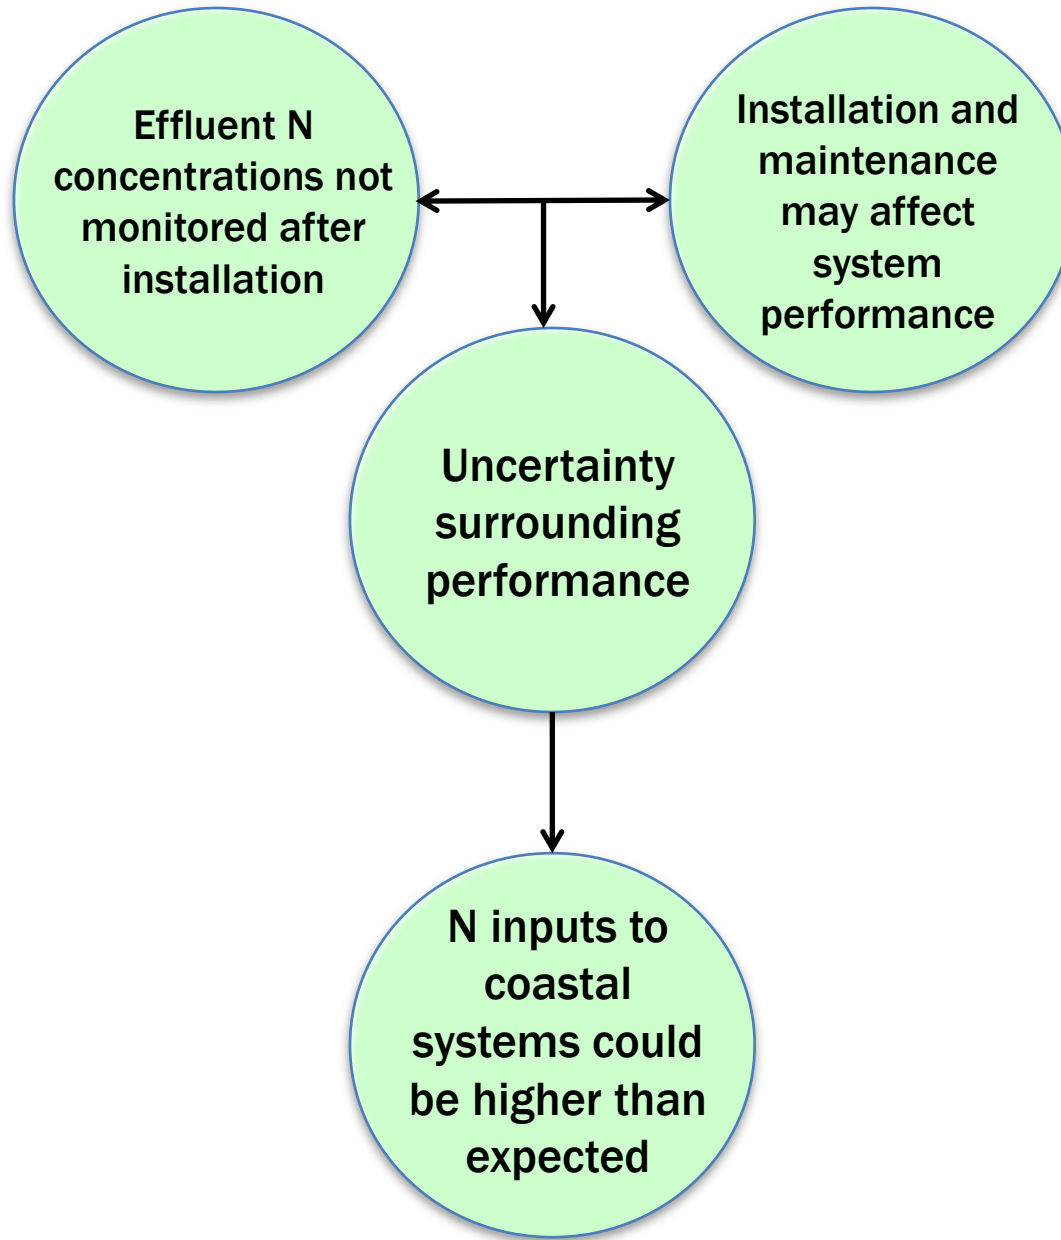

Advanced N Removal OWTS

50-75% TN Removal

Advanced OWTS in Rhode Island: Considerations

Our Approach:

Monitor system
performance and
operational
parameters

Develop statistical
model for
performance
optimization

Adjust systems
accordingly

Measure changes in
response to
adjustments

Sampling Design

We sample a total of 42 systems each month:

17 Systems

Orenco
Advantex
AX20[®]

http://www.orenco.com/sales/choose_system/index.cfm

14 Systems

BioMicrobics
FAST[®]

<http://www.biomicrobics.com/products/fast-wastewater-treatment-systems/microfast/>

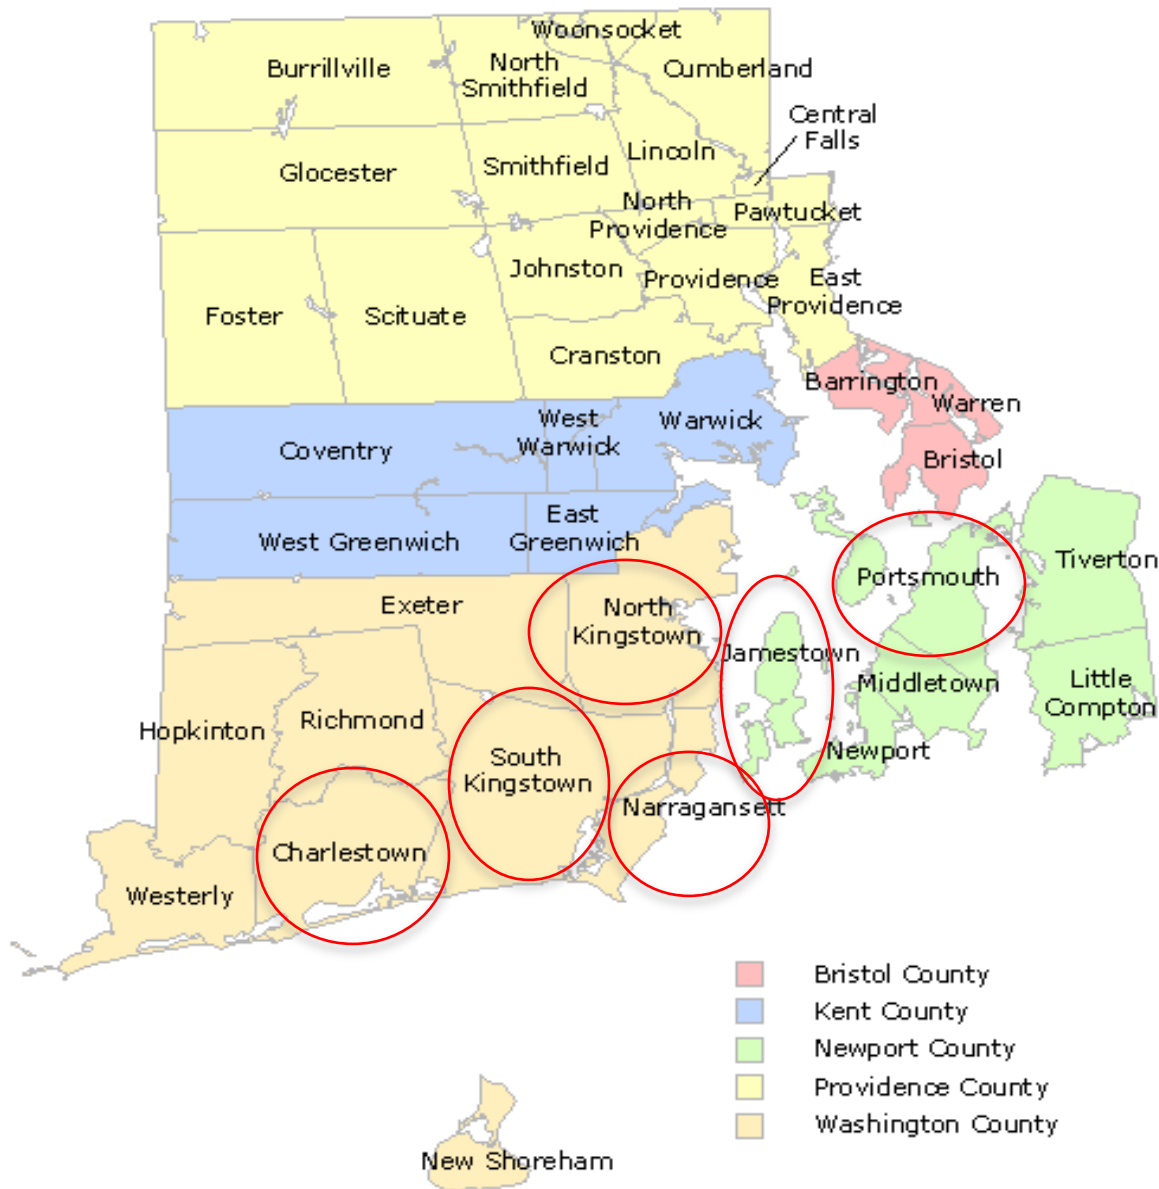

11 Systems

SeptiTech
D[®]

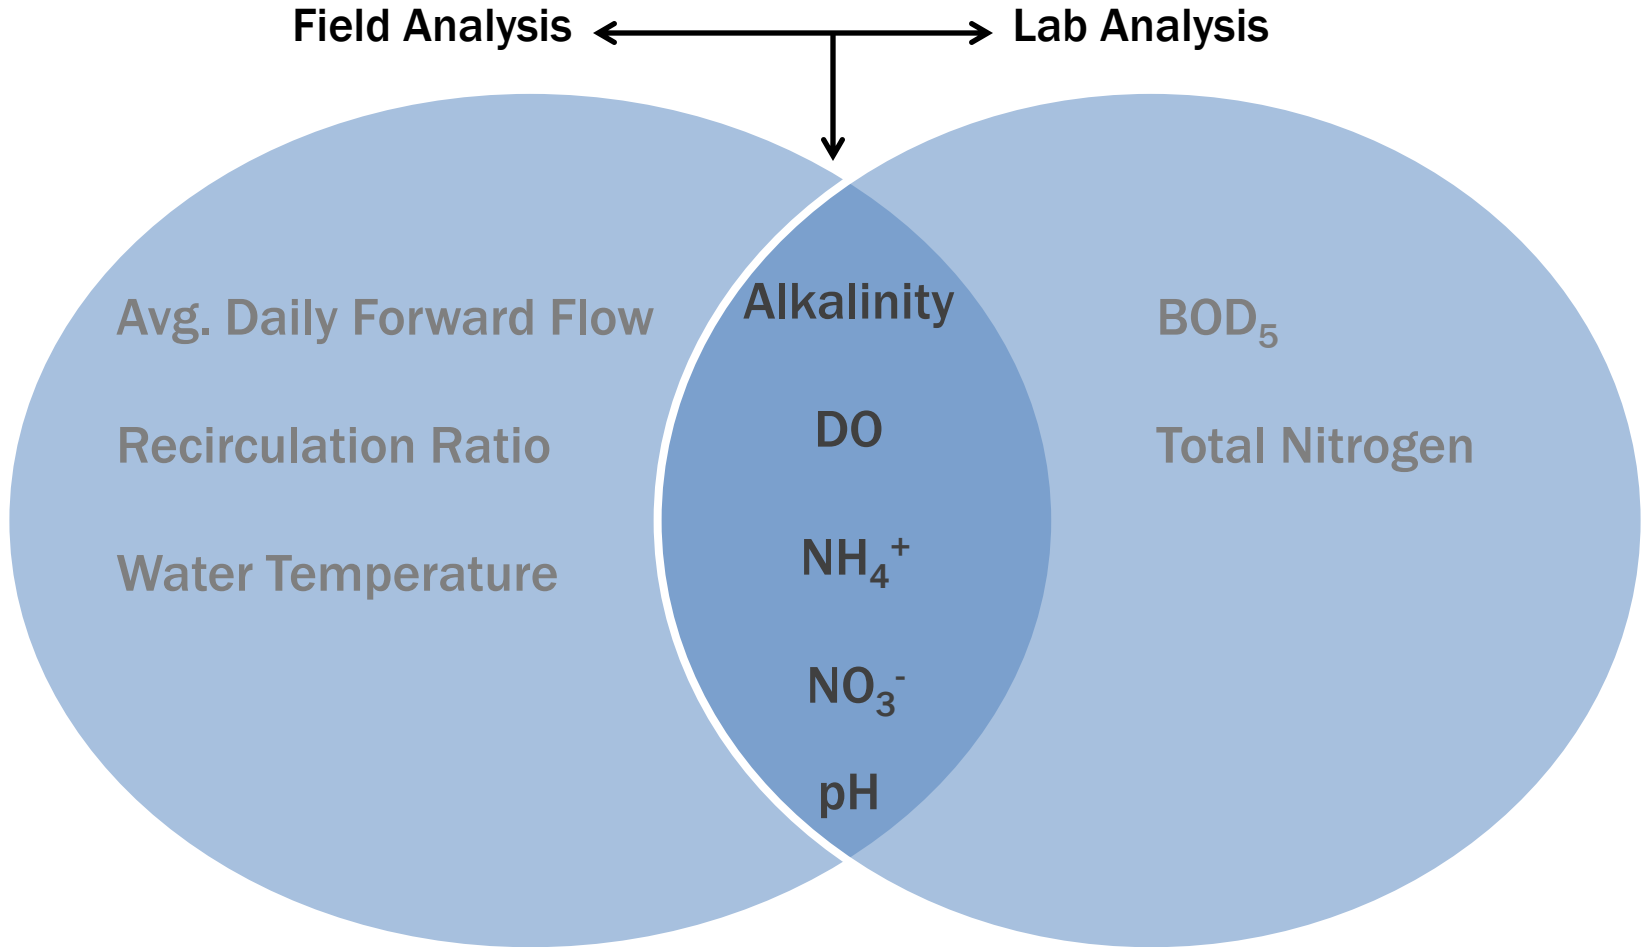

<http://www.septitech.com/staar-residential/>

Site Locations: Greater Narragansett Bay Watershed

Methodology: Operational Parameters

Overview

1. Project description
2. Evaluation of rapid field tests
3. Evaluation of Performance of Advanced N removal OWTS in the Narragansett Bay Watershed
4. Predictors of effluent total nitrogen
5. Conclusions

Evaluation of Rapid Field Tests

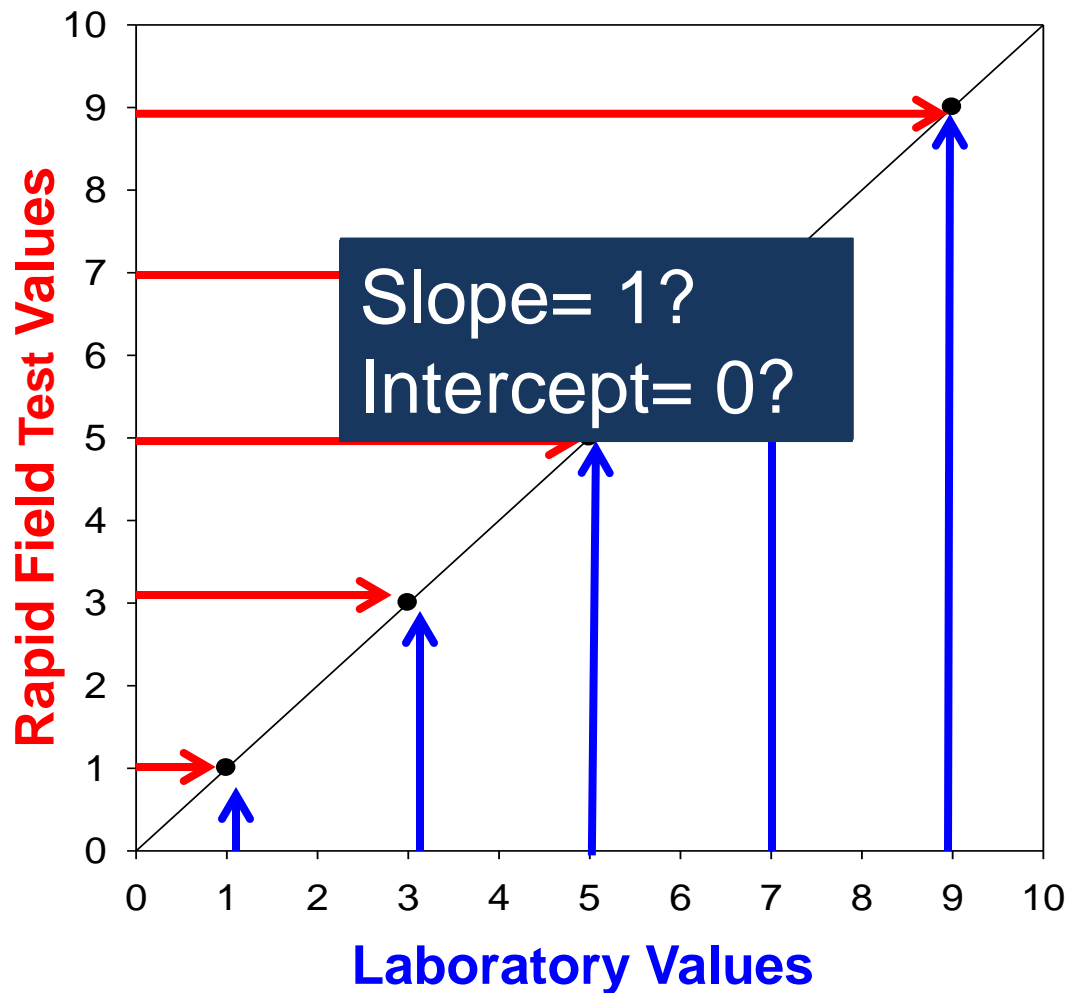

- Used by O&M service providers to evaluate system performance
- Provide quick results on-site
- Do they provide accurate results?

Evaluation of Rapid Field Tests: *Methods*

How is Accuracy Defined?

Rapid Field Test Methods

Property	Regression parameter:		
	Intercept	Slope	R²
Alkalinity	18.9*	0.9	0.4
Ammonium	4.5*	0.5*	0.8
Dissolved oxygen	2.4*	0.6*	0.5
Nitrate	1.5*	0.1*	0.1
pH – test strips	4.0*	0.1*	0.0
pH – pen	0.4	1.0	0.8

Rapid Field Test Methods : Used in the Laboratory

Regression parameter:

Property	Intercept	Slope	R ²
Alkalinity	10.8	1.6	0.2
Ammonia			0.7
Nitrate			0.6
pH			0.4

  **Accuracy**

Field Conditions and Error

Varying light conditions in the field complicate visual comparisons to color charts.

TO USE:

Immerse test strip for 2 seconds and remove with pads face up. **DO NOT SHAKE OFF EXCESS WATER.** Wait 1 minute and immediately compare to color chart.

TIPS

- Keep wet fingers out of the vial.
- For best results, immerse strip to a depth of 12"-18".
- Close vial tightly after removing strip.
- Store in a cool, dry place.

Accurate Rapid Field Test Methods

pH

Nitrate

Ammonium

**Ammonium
Nitrate
COD**

Overview

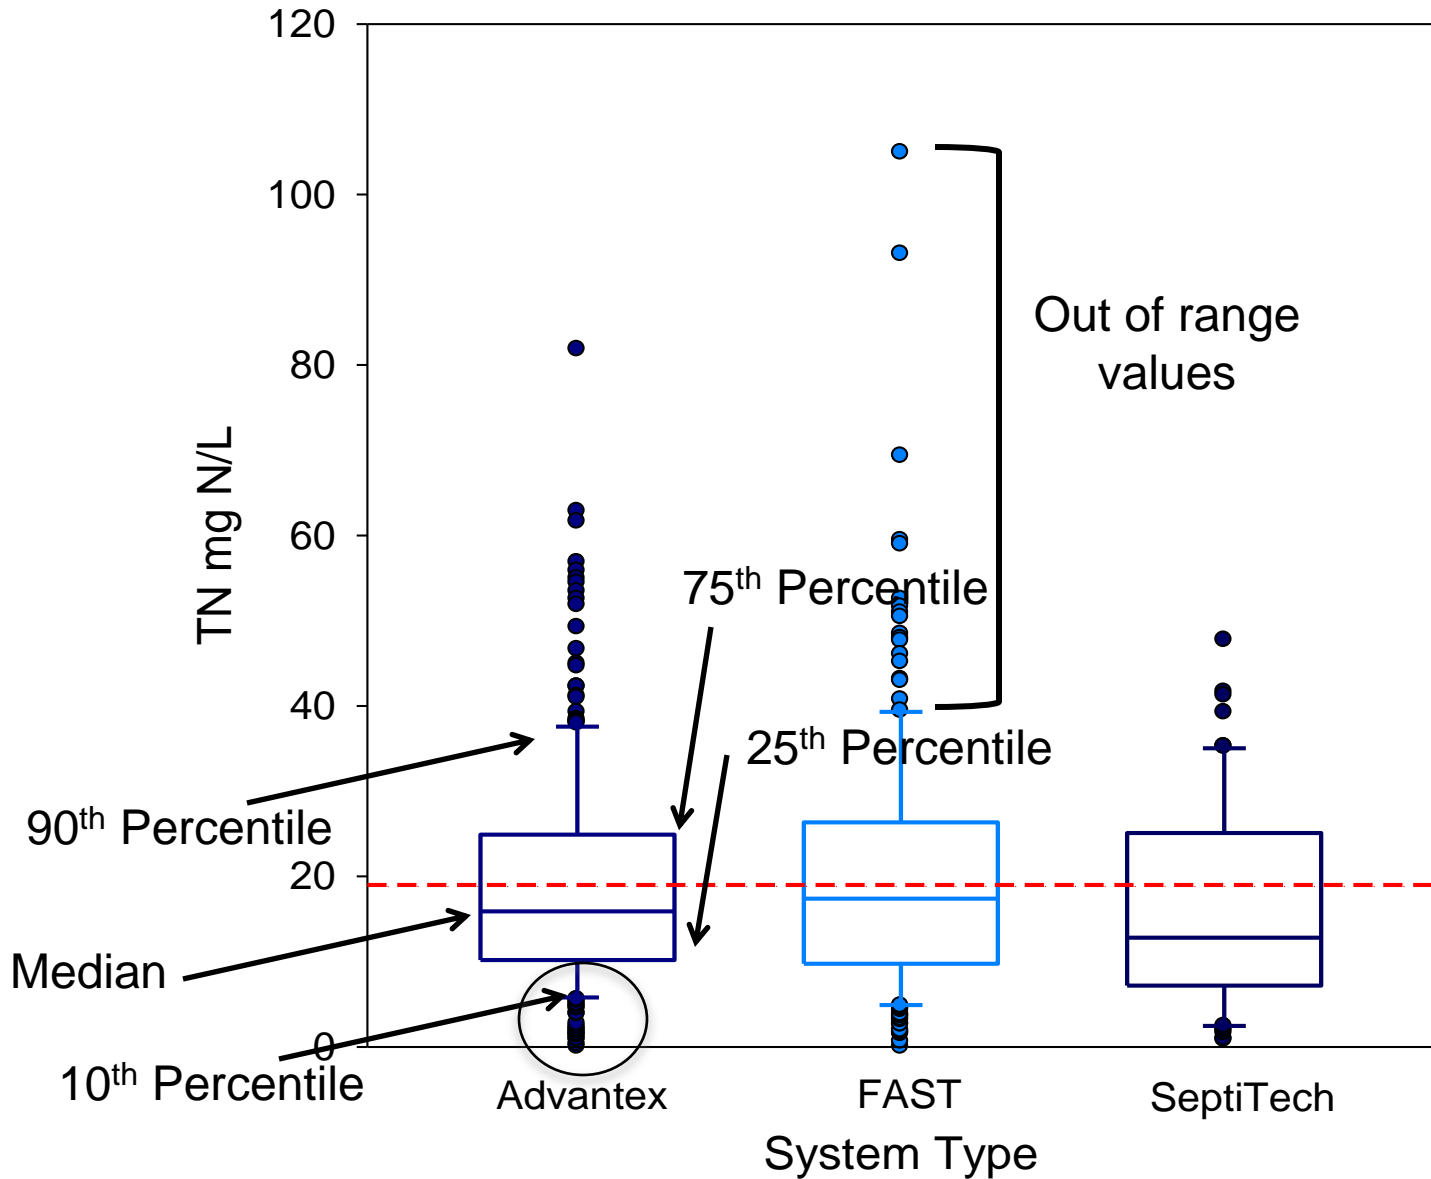

1. Project description
2. Evaluation of rapid field tests
3. Evaluation of Performance of Advanced N removal OWTS in the Narragansett Bay Watershed
4. Predictors of effluent total nitrogen
5. Conclusions

Evaluation of N Removal in Advanced OWTS

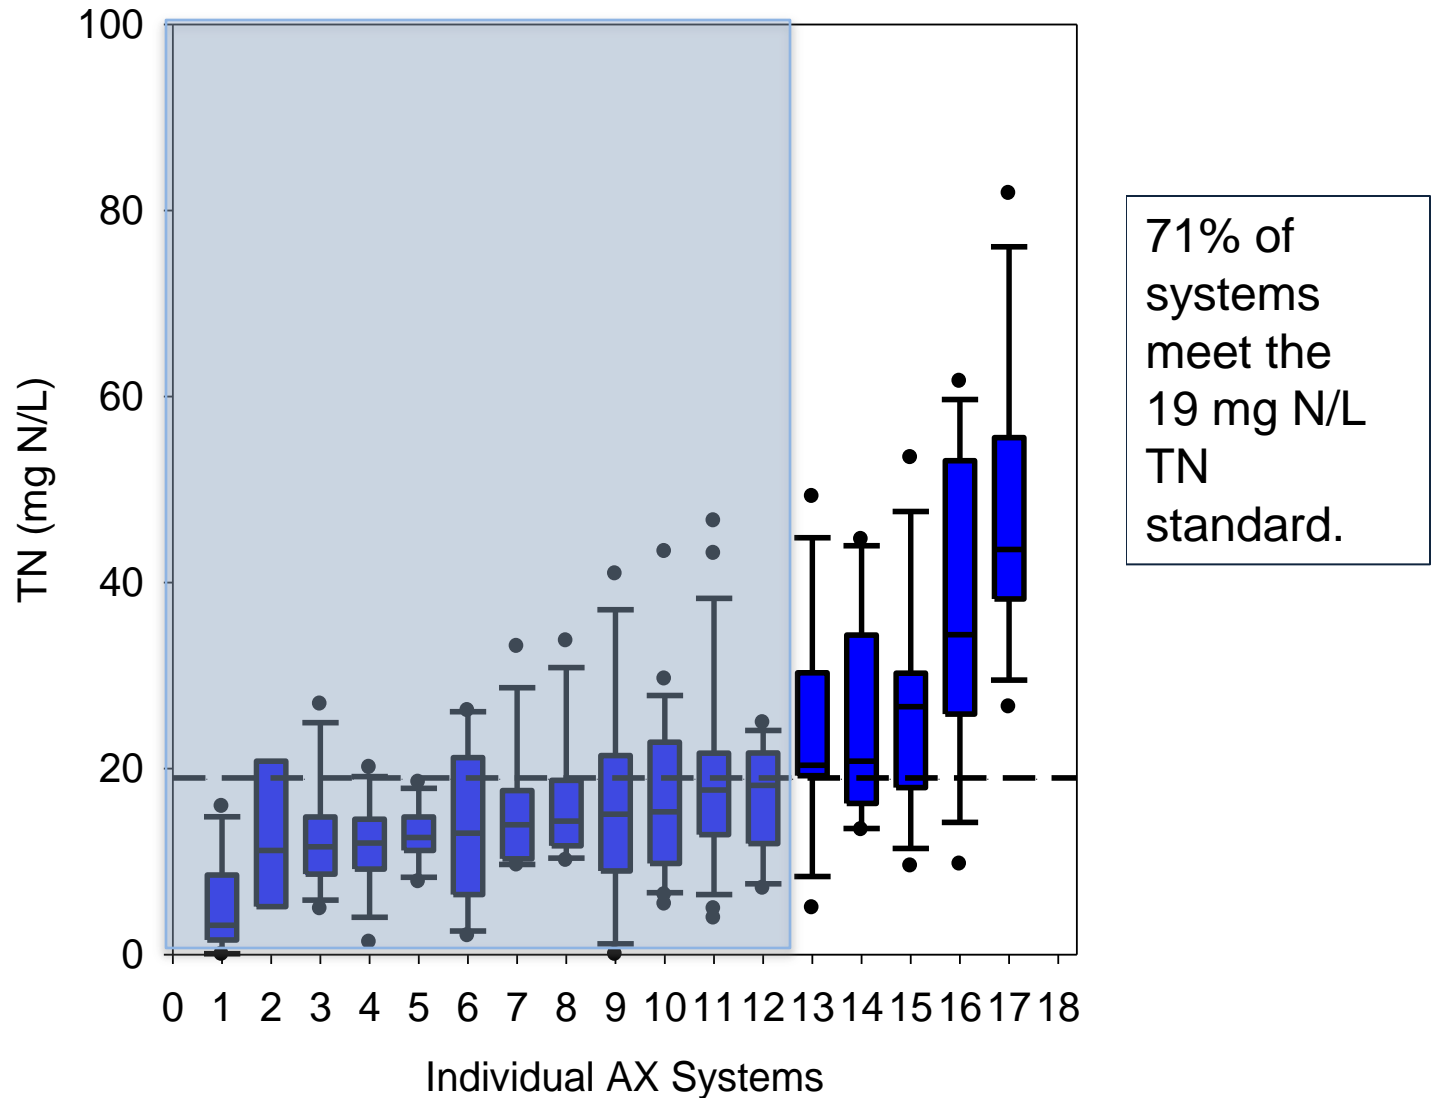

- Final effluent total nitrogen concentrations
- Collected from March 2015 to May 2016
- Standard laboratory values reported

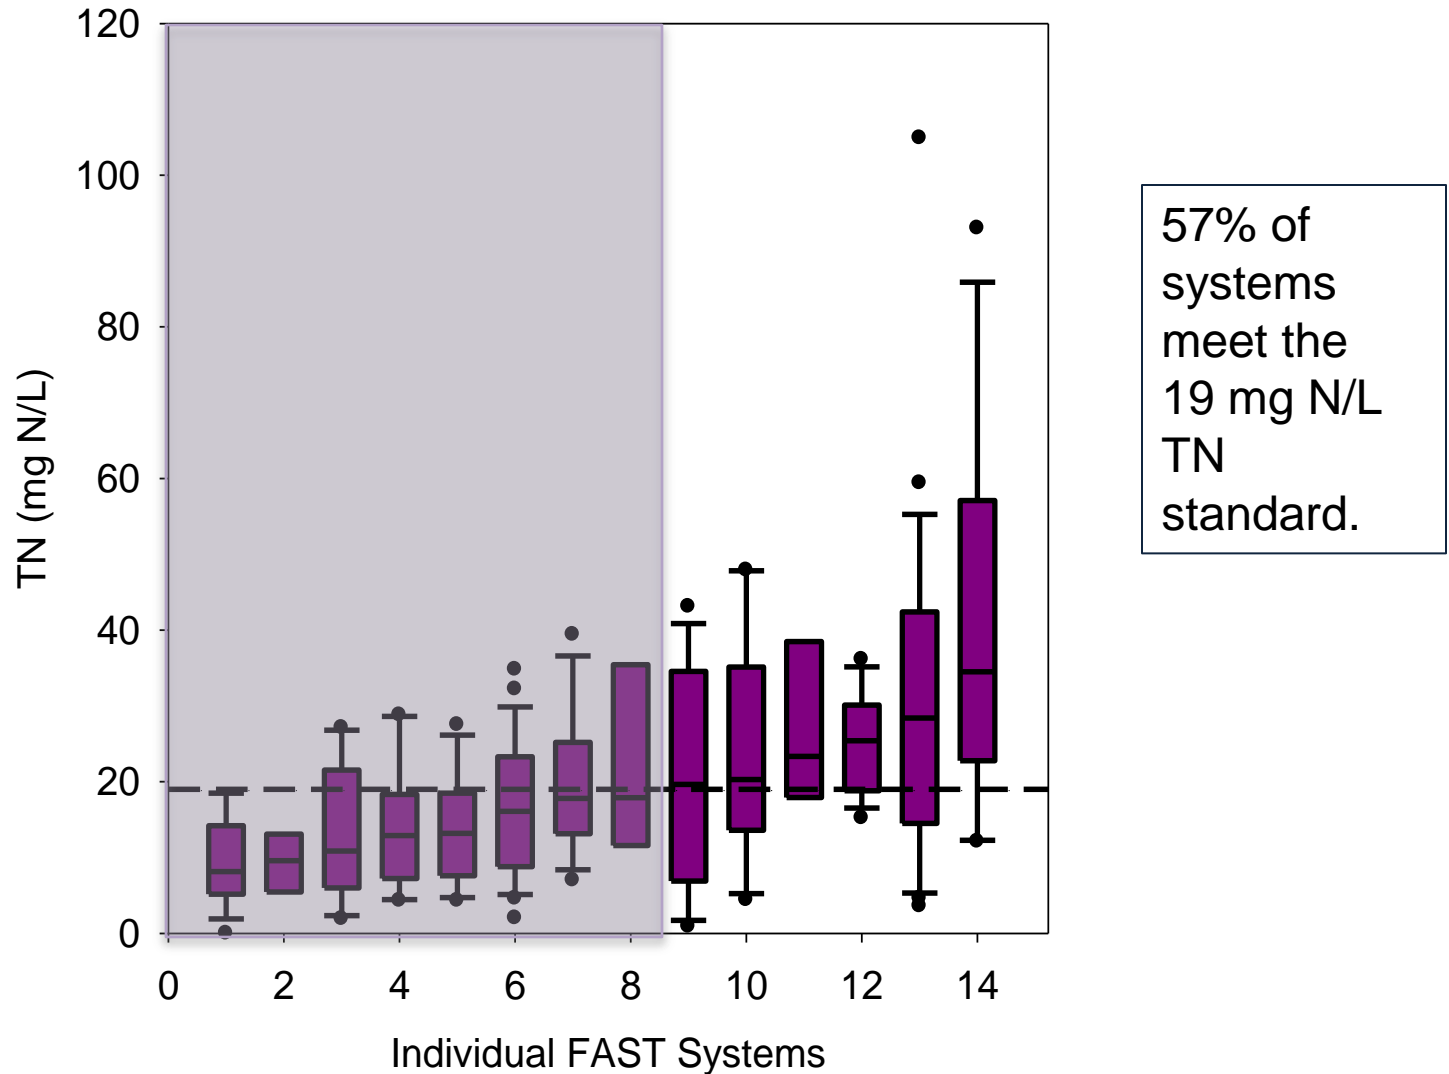

Distribution of TN Concentrations: March 2015 - May 2016

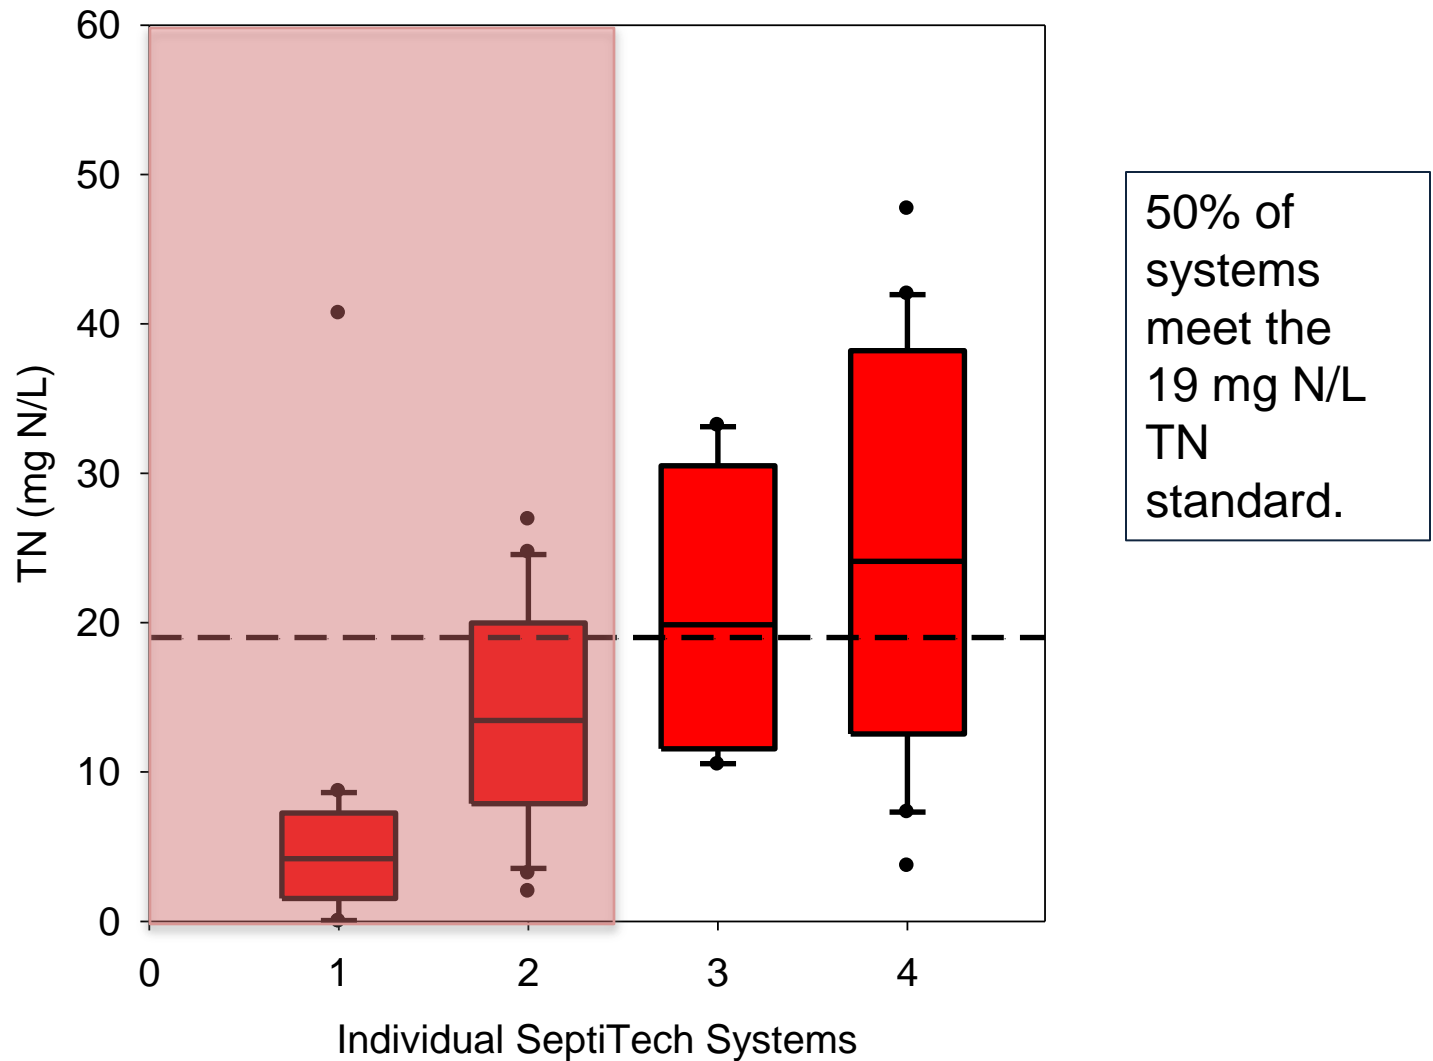

Advantex Systems: Distribution of TN Concentrations: March 2015 - May 2016

FAST Systems: Distribution of TN Concentrations: March 2015 - May 2016

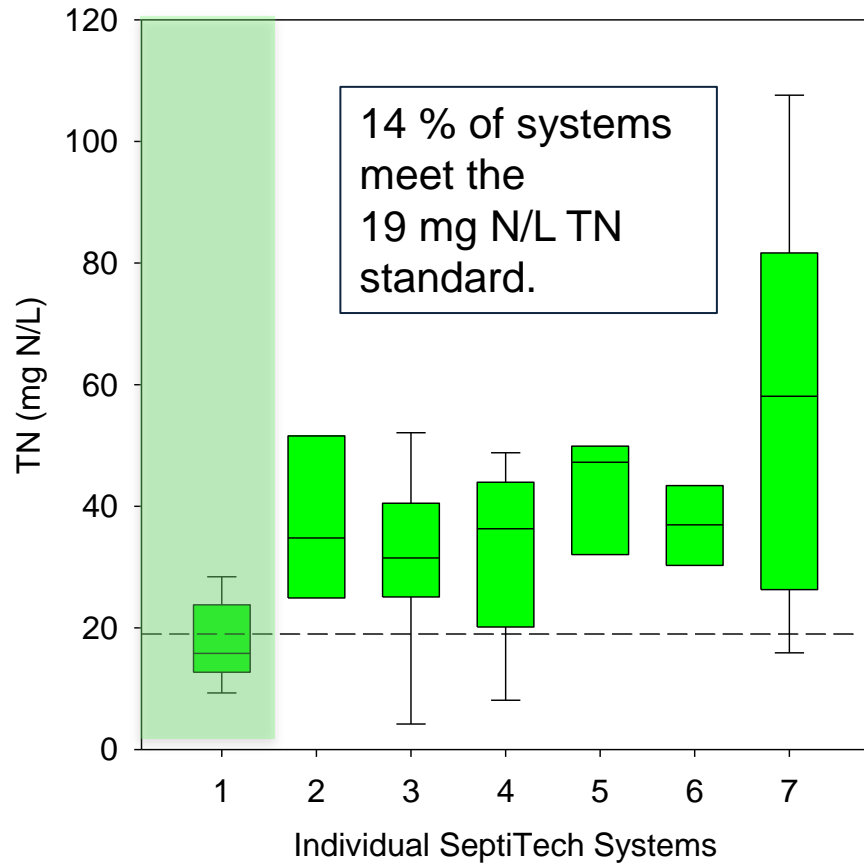

SeptiTech Systems: Distribution of TN Concentrations: March 2015 - May 2016

Individual SeptiTech Systems: Not turned on for Denitrification

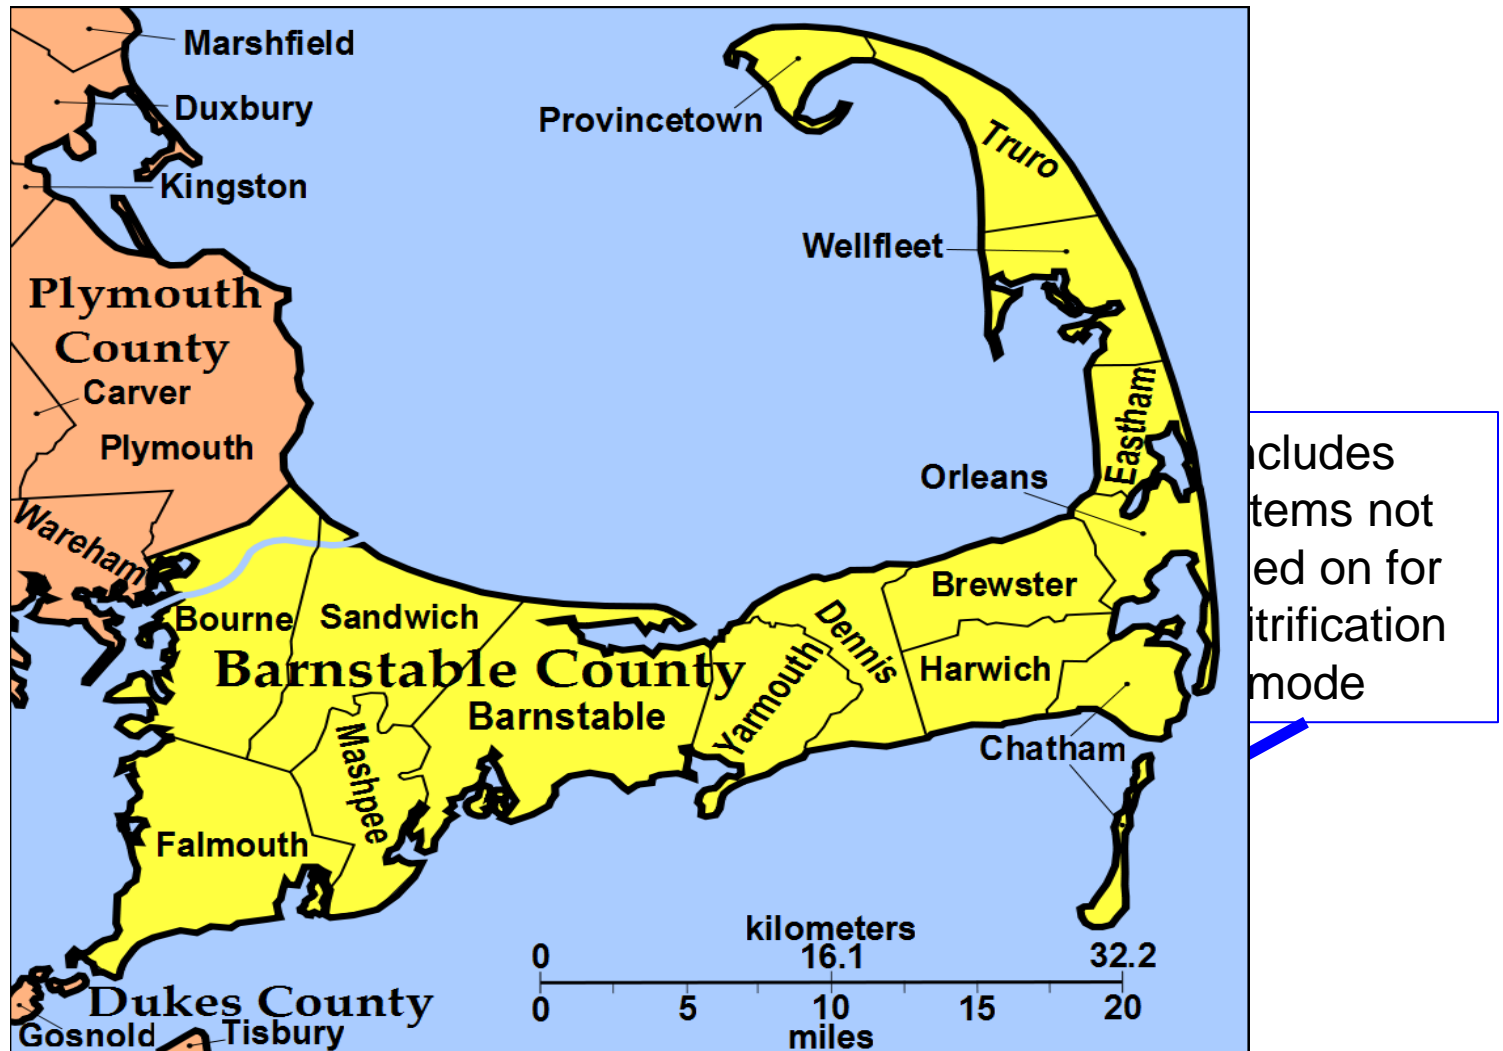

March 2015 - December 2015

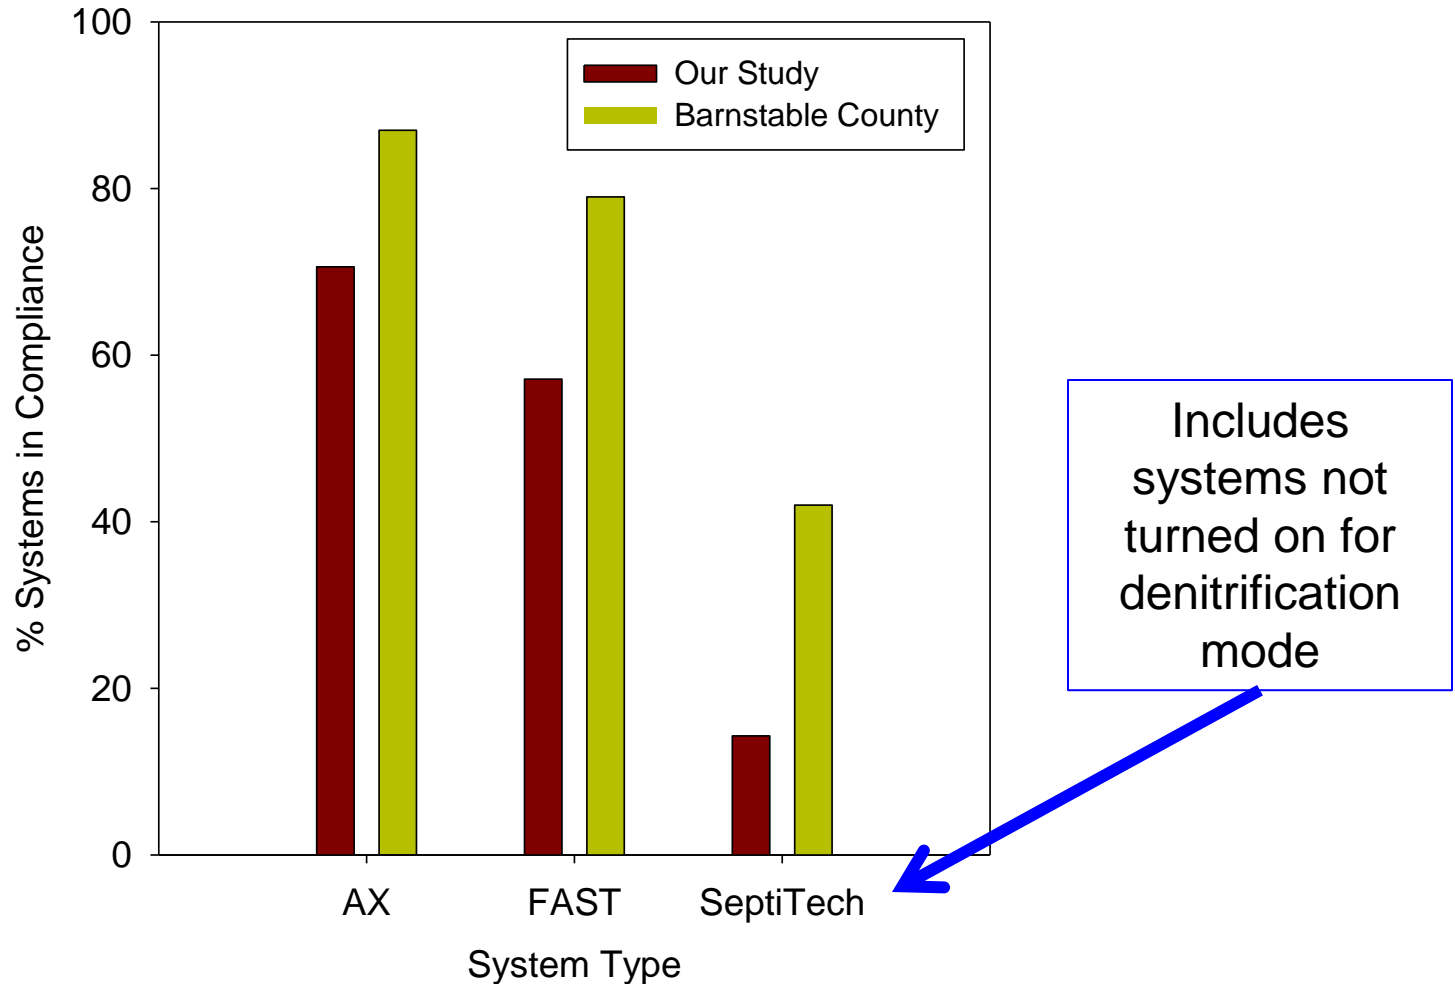

January 2016 - May 2016

Median TN Concentration: Narragansett vs. Barnstable County Systems

Percentage of Systems in Compliance: Narragansett vs. Cape Cod

+ Differences in Regulations

Rhode Island

- 2 maintenance visits required per year
 - Focus on mechanical function
 - Do not include effluent sampling
 - 19 mg N/L TN standard

Barnstable County, Massachusetts

- 4 maintenance visits required per year
 - Effluent sampling required
 - 19 mg N/L TN standard
- Online management database
 - Tracks maintenance visits
 - Tracks effluent constituent levels
 - Alerts when effluent does not meet standards

Overview

Monitor system performance and operational parameters

2. Evaluation of rapid field tests

Develop statistical model for performance optimization

3. Performance of Advanced N removal OWTS in the Narragansett Bay Watershed

Adjust systems accordingly

4. Predictors of effluent nitrogen

5. Conclusions

Measure changes in response to adjustments

Which Parameters Best Predict Effluent Total Nitrogen Concentration?

How well do these parameters correlate with TN?

Which parameters can serve as indicators for effluent TN?

Ammonium
Nitrate
Alkalinity
pH
DO
Sample Temperature
Average Forward Flow
Recirculation Ratio
BOD

Total Nitrogen

System Type

Significant Predictors of Total Nitrogen

Orenco
Advantex
AX20®

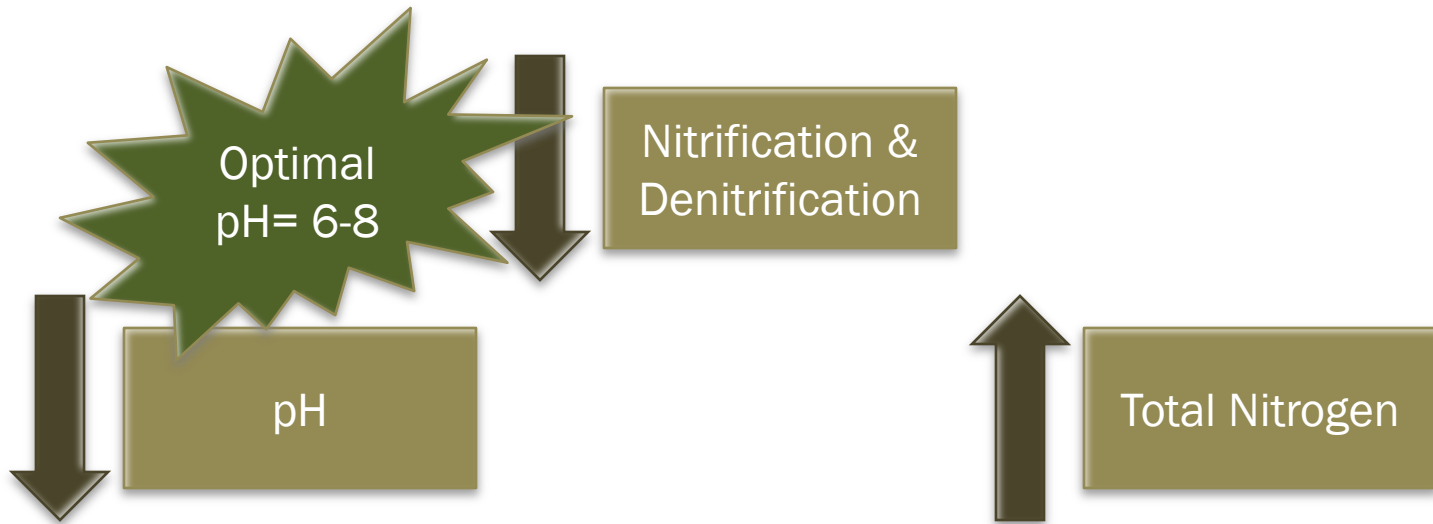

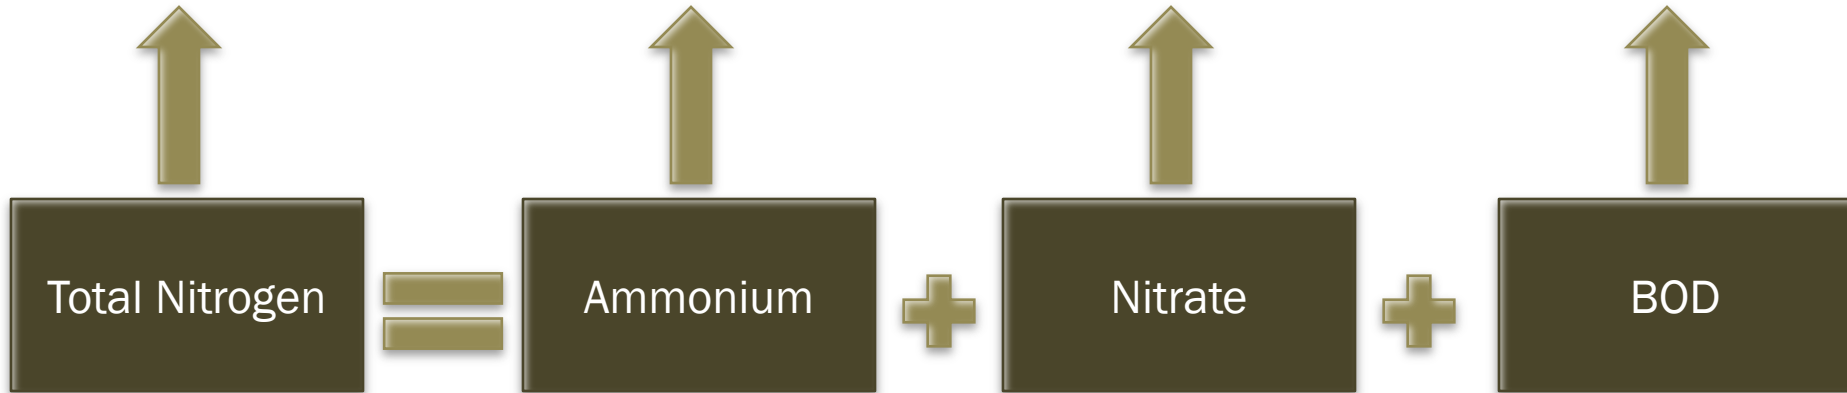

BioMicrobics
FAST®

SeptiTech
D®

Best Predictors of Total Nitrogen

In conclusion...

- **Accurate rapid field tests are available.**
- **Differences in regulatory requirements for monitoring influences management and may affect performance.**
- **Ammonium, nitrate, BOD, pH, and average forward flow are significant predictors of TN.**

Where are we now?

- Continuing to collect and analyze final effluent wastewater samples
 - Additional sampling in August
- Evaluating underperforming systems and working with service providers to make adjustments to improve N removal

We are hopeful!

- Monitored Massachusetts systems are performing better, but with the same level of management, RI systems can perform to standard.
- One town in RI is considering requiring effluent sampling during O&M visits.
